

Up to 100A, High-precision current sensor chip that With stands surge currents up to 13KA

Description

SC820 is a chip type current sensor with wide isolation distance and high current capacity developed by SENK SEMI. This product in 10.3mm*10.4mm*2.3mm wide-body SOP16 encapsulation on realized as low as 0.6mΩ current lead impedance, this enables it to be applied to power systems requiring continuous operation at measurements up to 100A.

SC820 series is an isolated current detection chip that uses the principle of open-loop Hall sensor detection. By introducing the current wire on the high-voltage side into the package, based on the magnetic effect of the current, the amount of iso-magnetic field generated around the wire under test is induced by the magnetic sensor of the built-in chip and converted to a treatable ethonal-voltage signal, which is amplified by the built-in high-precision ADC reading, with digital calibration technology, to remove environmental variables such as temperature, noise, hysteresis, nonlinearity, and finally the voltage value of the current under test is nearly ideal.

SC820 adopts automatic production and processing, can bring customers incomparable consistency, high quality and high reliability of module technology. Standard package design is very suitable for customers to carry out batch automatic patch production, which is the best solution for photovoltaic inverter, household appliances, charging pile.

SENK SEMI. is committed to the research of core chip technology, with the aim of bringing customers the best current detection solution.

Features

- 4.8kV RMS minimum isolation voltage
- Output voltage proportional to AC or DC currents
- Lowest Current conductor impedance: 0.6mΩ
- 13ka 8/20uS Surge isolation current
- Support Viout-Vref differential output mode
- Internal reference voltage
- $3\mu s$ output rise time in response to step input current
- Operating temperature range: -40°C~125°C
- Range of measured current:20A~100A
- Total output error<1% @T_A=25°C, <3% for full temperature range
- Strong driving ability
- Extremely simple peripheral circuit
- Built-in AC zero-crossing detection function
- Support wave soldering full-automatic patch and tape packaging
- It is not interfered by wire magnetic field, external magnetic field and geomagnetic field
- High PSRR
- Independent copyright of SENK SEMI.

SC820DFT-20U5				20		U(0.1Vcc)	200	

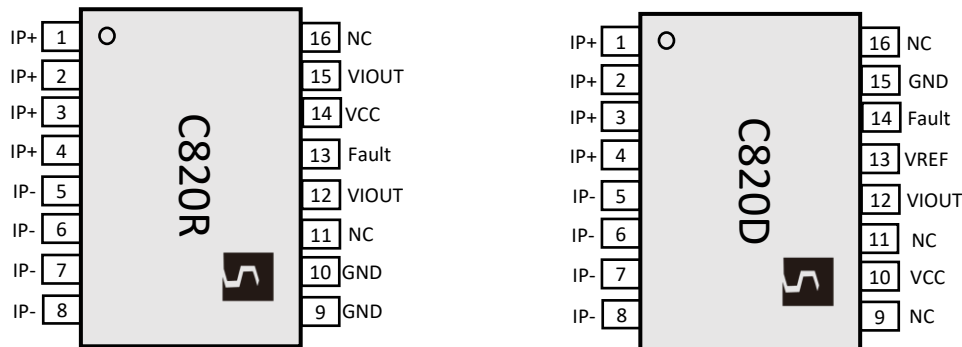

Note 1: F, B, U are different in the reference output when IP=0A, F is recommended by default.

F	when IP=0A, VIOUT@0A=VREF=2.5V, suitable for bidirectional current detection, Zero Current voltage and sensitivity is fixed
B	when IP=0A, VIOUT@0A=0.5*VCC, suitable for bidirectional current detection, Zero Current Output and sensitivity vary with VCC ratio
U*2,3	when IP=0A, VIOUT@0A=VREF=0.1*VCC, suitable for unidirectional current detection, Zero Current Output and sensitivity vary with VCC ratio

Note 2: Model U, dynamic range x2, sensitivity x2; if there is any other sensitivity requirement, can connect our FAE or agent.

Note 3: Model U, is sample at present.

Pin Configuration

Pin of 820RFT	Pin of 820DFT	Pin Name	Description
1/2/3/4	1/2/3/4	IP+	The primary current is input to the positive terminal, Supports connections to 1/2/3/4 pins
5/6/7/8	5/6/7/8	IP-	The primary current is output to the negative terminal, Supports connections to 5/6/7/8 pins
9/10	15	GND	Signal Ground terminal
12/15	12	VIOUT	Analog output signal. VIOUT=IP*Sens+Vref
14	10	VCC	Device power supply
	13	VREF	Internal or External output: Equal to Vout@IP=0A
13	14	VFault	Over current Fault pin. When current flowing between IP+ pins and IP- pins exceeds the overcurrent fault threshold, this pin transitions to a logic low state.

Thermal Rise vs.Primary Current

Typical Plastic package temperature[°C] of SC820 vs Primary current [A] based on Demo Board

Demo Board information

Parameter	Units
Layer Number	2
Copper layer thickness	4 Oz
Total Copper size connected to Primary pins(including all layers)	1520mm ²
Board Thickness	1.6mm

Fuctional Block Diagram

Absolute Maximum Ratings

Absolute maximum ratings are limiting values to be applied individually, and beyond which the serviceability of the circuit may be impaired. Functional operability is not necessarily implied. Exposure to absolute maximum rating conditions for an extended period of time may affect device reliability.

Characteristic	Symbol	Notes	Rating	Unit
Supply voltage	V _{CC}		6.0	V
Reverse Supply Voltage	V _{RCC}		-0.1	V
Output Voltage	V _{IOUT}		6.0	V
Reverse Output Voltage	V _{RIOUT}		-0.1	V
Nominal Operating Ambient Temperature	T _A	Range F	-40~125	°C
Maximum Junction Temperature	T _{J(max)}		165	°C
Storage Temperature	T _{stg}		-65~165	°C
Output Current Source	I _{OUT(Source)}	Shorted Output-to-Ground Current	4.5	mA
Output Current Sink	I _{OUT(Sink)}	Shorted Output-to-VCC Current	40	mA
Vref Current Source	I _{REF(Source)}	Shorted Vref-to-Ground Current	4	mA
Vref Current Sink	I _{REF(Sink)}	Shorted Vref-to-VCC Current	40	mA
Overcurrent Fault Output Pin Resistance	R _{vfault}	Pull-up Voltage under VCC is not allowed	2	kΩ
The Pull-up Voltage Of Vfault	V _{CCfault}	Open drain output, Connected to VCC is allowed	8	V
Maximum Continuing IP Current	I _{Pmax}	Based on SENK's Demo Test Board	65	A
Transient Over Current At Ambient Temperature	I _{POver}	Based on SENK's Demo Test Board, 1pulse, 100ms, 1% Duty Cycle	125	A
HBM mode	ESD		4	kV

Isolation Characteristics

Parameter	Symbol	Value	Unit	Comment
RMS voltage for AC insulation test, 50Hz, 1min	V _{ISO}	4800	V _{rms}	Agency type-tested for 60 seconds per UL60950-1
Working Voltage for Basic Isolation	V _{WVBI}	1550	V _{Peak}	Maximum working voltage according to UL60950-1
		1097	V _{rms}	
Working Voltage for Reinforced Isolation	V _{WVRI}	800	V _{Peak}	Maximum approved working voltage for reinforced isolation according to UL 60950-1
		565	V _{rms}	
Clearance	D _{cl}	8.2	mm	Minimum distance through air from IP leads to signal leads
Creepage distance	D _{cr}	8.2	mm	Minimum distance along package body from IP leads to signal leads
Comparative trackong index	CTI	600	V	the electrical breakdown (tracking) properties of an insulating material
Maximum surge isolation voltage	V _{IOSM}	10	kV	V _{TEST} =1.3 x V _{IOTM} =13000V _{PK} , 1.2/50us waveform
Maximum Transient impulse current	I _{IOSM}	13	kA	I _{TEST} =I _{IOTM} , t=8/20us(qualification);

Reference application Specification

Symbol	Description	Min	Typ	Max	Unit
C _{VCC}	The filter capacitor of power supply is connected between vcc and gnd	0.1	0.47	/	uF
C _{V_{IOUT}}	The filter capacitor of Output is connected between Vout and gnd		1	1.5	nF
C _{VREF}	The filter capacitor of Output is connected between Vref and gnd	50	100	1000	pF
R _{Vfault}	The pull-up resistance is connected between Vfault and VCC	2	10	100	kΩ

Common Electrical Characteristics

Note: Over full range of $T_A=25^\circ\text{C}$, $C_{\text{Bypass}}=0.47\mu\text{F}$, $C_{\text{Load}}=1.0\text{nF}$, $V_{\text{CC}}=5\text{V}$, sensitivity=40mV/A

Characteristic	Symbol	Test Comditions	Nin	Typ	Max	Unit
Supply Voltage	V_{CC}	Operating	4.5	5	5.5	V
Supply Current	I_{CC}	$V_{\text{CC}} = 4.5\sim 5.5\text{V}$, output open		20		mA
Output Capacitance Load	C_{L}	VIOU to GND		1.0	1.5	nF
Output Resistive Load	R_{L}	VIOU to GND	3	10		k Ω
VREF Capacitance Load	C_{LREF}	VREF to GND	50	100	1000	pF
VREF Resistive Load	R_{LREF}	VREF to GND	3	10		k Ω
Hall coupling factor	CF	$T_A = 25^\circ\text{C}$		1.31		G/A
Anti-external magnetic interference suppression ratio	CMFR	The external interference magnetic field perpendicular to the chip surface		-50.1		dB
Primary Conductor Resistance	R_{PRIMARY}	$T_A = 25^\circ\text{C}$		0.6	1	m Ω
Temperature Coefficient of Primary Conductor Resistance	TC_{R}	$T_A=-40\sim 125^\circ\text{C}$		3820		ppm/ $^\circ\text{C}$
Hysteresis Voltage	V_{hys}	$V_{\text{iout}}(\text{IP to } +40\text{A then return to } 0\text{A})$ - $V_{\text{iout}}(\text{IP to } -40\text{A, then return to } 0\text{A})$		1		mV
Rise time	t_{r}	IP=50A(50A/us)		1.4		μs
Propagation Delay	t_{pd}	IP=50A(50A/us)		1.4		μs
Response Time	t_{response}	IP=50A(50A/us)		2		μs
Bandwidth	F	Small-Signal-3 dB,		200		kHz
Noise Density	I_{ND}	$T_A = 25^\circ\text{C}$, $C_{\text{L}}=1\text{nF}$		1403.1		$\mu\text{A}(\text{rms})/\sqrt{\text{Hz}}$
Noise	I_{N}	NC		427		mA(rms)
	I_{N}	RC filter BW=10KHz		123		mA(rms)
	I_{N}	RC filter BW=1KHz		82		mA(rms)
Nonlinearity	E_{LIN}	-50A<IP<50A			1	%
Bidirectional Quiescent Output (suitable for product with suffix B5)	S_{coef}	$V_{\text{CC}}=4.5\sim 5.5\text{V}$, $S_{\text{coef}}=\text{Sens}(V_{\text{CC}})/\text{Sens}(5\text{V})$		$V_{\text{CC}}/5$		
Sensitivity under fixed zero voltage(suitable for product with suffix F5)		$V_{\text{CC}}=4.5\sim 5.5\text{V}$		$2000/I_{\text{PR}}$		mV/A
$V_{\text{out}}@0\text{A}$ under fixed zero voltage(suitable for product with suffix F5)		$V_{\text{CC}}=4.5\sim 5.5\text{V}$		2.5		V
VIOU LinearRail to Rail Output Range	$V_{\text{rail-rail}}$	$R_{\text{L}}=4.7\text{k}\Omega$	10		90	%VCC
Power-On Time	t_{PO}	Output reaches steady state level, $T_j = 25^\circ\text{C}$		100	200	μs
PSRR of $V_{\text{OUT}}@0\text{A}$ (suitable for product with suffix F5)	PSRR _Q			53		dB
PSRR of Sensitivity(suitable for product with suffix F5)	PSRR _S			21		dB
FAULT Function	I_{OP}	Primary Current Continuously Increases From IP, Until VFault is low		± 135		%IP
	I_{RE}	Primary Current Continuously Decreases From IP, Until VFault is high		± 110		%IP
	$T_{\text{r_fault}}$	Response Time of VFault		2		μs
	T_{HOLD}	Hold Time of VFault		2		μs

Accuracy Characteristic Curve (SC820DFT-20F5)

AC & Dynamic Characteristic Curve

Functional Description

◆ Internal Reference Voltage

The device has an internal resistor divider from the analog supply VCC that determines the zero-current output voltage, VOUT@0A. This zero-current output level along with sensitivity determine the measurable input current range of the device, and allows for unidirectional or bidirectional sensing, as described in Absolute Maximum Ratings. The SC820xxT-xxB5 variants have a zero-current output set by Equation 1, while the SC820xxT-xxU5 devices have a zero-current output voltage set by Equation 2 and the SC820xxT-xxF5 have a zero-current output voltage set by Equation 3.

$$V_{OUT@0A} = V_{CC} \times 0.5 \quad (1)$$

$$V_{OUT@0A} = V_{CC} \times 0.1 \quad (2)$$

$$V_{OUT@0A} = 2.5V \quad (3)$$

◆ Vfault Function

Vfault pin are used as an indicator output in over-current detection after pulling-up to VCC.

When primary current exceeds I_{OP} and after T_{R_fault} , Vfault pin will be low;

When primary current is below I_{RE} and after T_{HOLD} , Vfault pin will be high;

Parameter definition:

I_{OP} : Action threshold point, for SC820, $I_{OP} = I_P \times 1.33$

I_{RE0} : Recover threshold point

I_{HYS} : Hysteresis, $I_{HYS} = |I_{OP}| - |I_{RE}|$

T_{R_fault} : The response time of Fault

T_{HOLD} : The hold time of Fault

◆ Proportional Coefficient Of Sensitivity(suitable for products with suffix B or U)

Sensitivity ratio coefficient (sens_coef), which defines the coefficient proportional to the sensitivity and VCC. The ideal coefficient is 1. If the VCC increases by 10%, the sensitivity will increase by 10%. At this time, the coefficient is 1.1, which means that the sensitivity increases by 10% compared with the ideal proportion. The relationship between the scale coefficient is described by the following equation:

$$S_{coef} = Sens_coef = SENS_{VCC} / SENS_{VCCN}$$

It is the ratio of the sensitivity $SENS_{VCC}$ under the supply voltage Vcc to the sensitivity $SENS_{VCCN}$ under the rated supply voltage VCCN. Through this value, we can get the sensitivity under any supply voltage.

In ideal situation:

◆ Proportional Relationship

Zero-current voltage is fixed at 2.5V and sensitivity is fixed at $2V/IP_{MAX}$ when VCC change if using SC820xFT**F5. IP_{MAX} is the Maximum current.

Zero-current voltage is fixed at $VCC/2$ and sensitivity is fixed at $SENS_{VCC} \times Sens_coef$ when VCC change if using SC820xFT**B5.

Zero-current voltage is fixed at $VCC/10$ and sensitivity is fixed at $SENS_{VCC} \times Sens_coef$ when VCC change if using SC820xFT**U5.

◆ Impact of External Magnetic Fields

CMFR is used to express the ability of sensor resisting impact of external magnetic fields. The larger the absolute value of CMFR, the stronger the ability to resist external magnetic interference is.

$$CMFR = 20 \lg \left| \frac{A_{CM}}{Sens/CF} \right|$$

CF is the coupling factor in G/A, multiplying by the sensitivity of the part(Sens)gives the error in mV.

For example: CMFR= -40dB, Sens = 40mv/A, CF = 10G/A, then A_{CM} is 0.04mv/G.

◆ Power Supply Rejection Ratio(suitable for products with suffix F)

Sensitivity power supply rejection ratio(PSRR_S)It refers to the sensitivity change rate $(SENS_{VCC}-SENS_{VCCN})/SENS_{VCCN}$ caused by the power supply change rate $(VCC-VCC_N)/VCC_N$. The absolute value of the ratio is 20 times of the common logarithm, the unit is dB.

$$PSRR_S = 20 \lg \left| \frac{(VCC - VCC_N)/VCC_N}{(SENS_{VCC} - SENS_{VCCN})/SENS_{VCCN}} \right|$$

Zero current power supply rejection ratio(PSRR_Q)It refers to the zero point change $VOE - VOE_N$ caused by the change of voltage $VCC - VCC_N$. The absolute value of the ratio is 20 times of the common logarithm, the unit is dB

$$PSRR_Q = 20 \lg \left| \frac{VCC - VCC_N}{VOE - VOE_N} \right|$$

◆ Delay time t_{pd} and Response time $t_{response}$

Both delay time and response time are used to characterize the time difference between primary side and secondary side;

The delay time is the time difference when the secondary output reaches 20% of the steady-state output value and the primary output reaches 20% of the steady-state current;

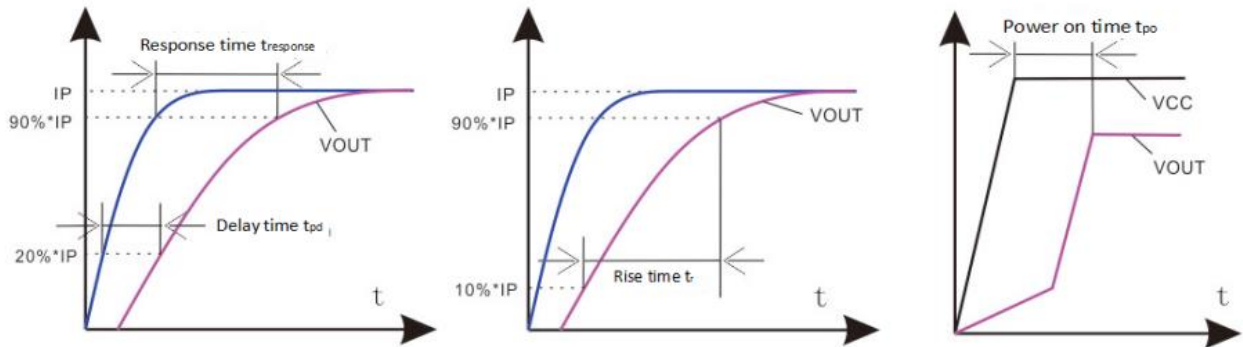

The response time is the time difference when the secondary output reaches 90% of the steady-state output value and the primary output reaches 90% of the steady-state current.

Rise Time t_r

The time interval between a) when the sensor IC reaches 10% of its full-scale value, and b) when it reaches 90% of its full-scale value. The rise time to a step response is used to derive the bandwidth of the current sensor IC, in which $f(-3 \text{ dB}) = 0.35/t_r$. Both t_r and t_{RESPONSE} are detrimentally affected by eddy-current losses observed in the conductive IC ground plane.

Power-On Time t_{po}

Power-On Time is defined as the time it takes for the output voltage to settle within $\pm 10\%$ of its steady-state value under an applied magnetic field, after the power supply has reached its minimum specified operating voltage.

◆ Thermal resistance $R_{\theta JA}$

Based on a demo board, the thermal resistance is calculated by measuring the chip top temperature and power value. According to the thermal resistance, the junction temperature can be calculated as a reference. The actual surface temperature measurement value is shown in the relationship between the package temperature and the measured current.

$$T_J = T_A + (R_{\theta JA} * \text{POWER}) = T_A + (R_{\theta JA} * IP^2 * R_{\text{PRIMARY}});$$

Where T_J is junction temperature and T_A is ambient temperature.

◆ Typical Application

1. Typical application of Differential output:
 $V_{\text{OUT}} = IP * \text{Sensitivity} * (5R / R) * (V_{\text{ref}} - V_{\text{iout}})$

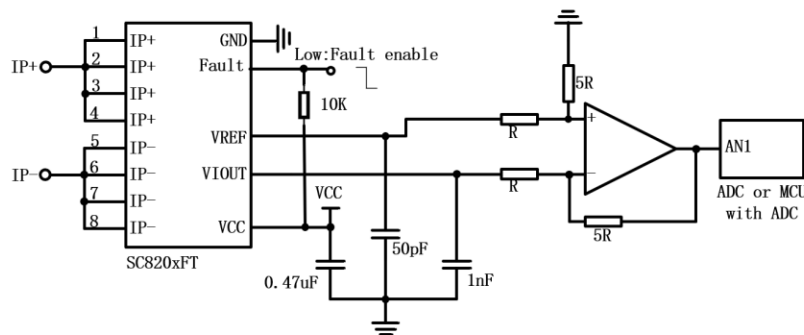

Fig1. Typical application diagram with Differential output

2. Typical application of single-ended output:
 $V_{OUT} = I_P * \text{Sensitivity} + V_{ref}$

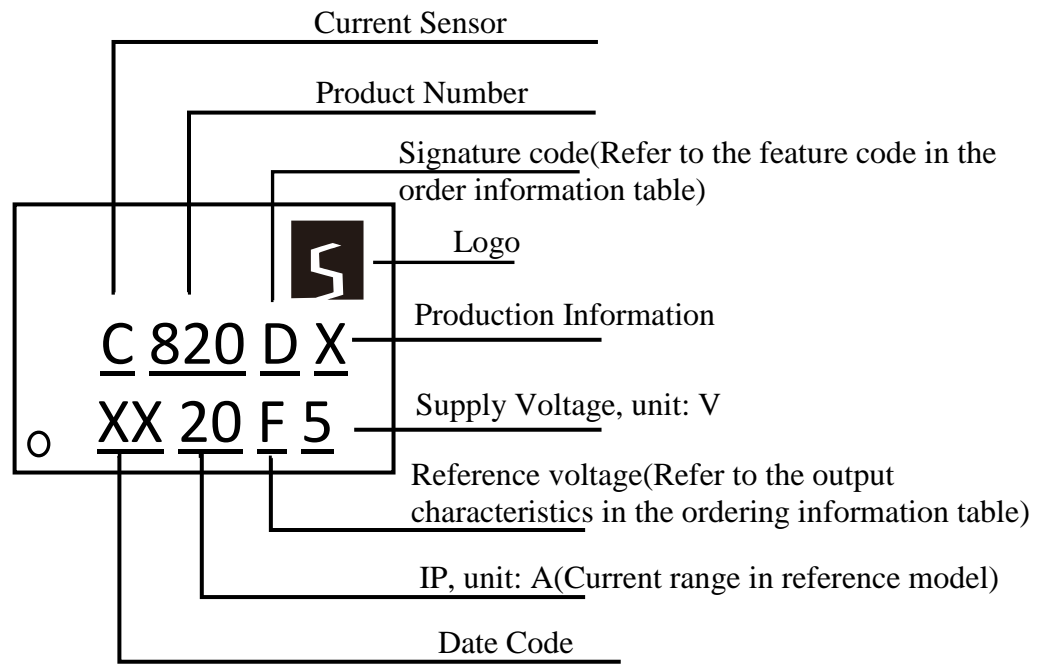

Fig2. Typical application diagram with single-ended output

Revision History

Revision	Change	Page	Author	Date
1.0	Initial draft		Jon	2014.03
2.0	Add unipolar IP detect mode; Add Common mode field rejection; Add figure, modify sensitivity; Add SC820N; Change Part Number in Order Information; Modify Max Current Tolerance; Remove Noise Spec, Charts; Change Part Number;		Hao	2017.06
3.0	Change Symbol define; Change part name and selection guide; Add reference schematic diagram; Add MP & sample information;		Tom	2018.06
4.0	Change package info. And update e/c table; Delete high sensitivity product, SC820NFT series change, revise Individual Performance Characteristics, add Characteristic Performance, add Thermal Rise vs. Primary Current ; Revise Primary Conductor Resistance according to test result; Add Nonlinearity & 25°C parameters; Add SC820NFT-50F5 Individual data. Delete FAULT related information; Revise pin assignment picture. Revise Thermal Rise vs. Primary Current ; ADD SC820RET-25B5, SC820RET-20B5; DEL FAULT IN FEATURE; Add PCB LAYOUT reference view;		Tom	2019.02
5.0	Add Application Information; Update marking information and standardized typesetting; Modify the information of some VREF and precision parameters; Supplement version D to be compatible with the application; Page2, supplement the R / D / N difference, Page7, supplement the parameters of NFT-50F5, - 65B5; Page2, update R encapsulation definition; Add 20U5; Page2, change 4 model codes, and supplement vfault function parameters; Add SC820RFT-40F5; Modify differential application formula ;		Jerry	2020.02
6.0	Modify the isolation withstand voltage parameters and update the block diagram; Accuracy parameter correction; Add UL and environmental protection signs; Add 50F5 performance index parameters; Modify part of the data and description; Add working voltage for reinforced isolation; Modify POD; Add SC820DFT-100F5 / SC820RFT-30F5 ;Add SC820DFT-66F5 and Performance parameter& SC820DFT-40F5		LEC	2023.12
